

Sustainable Development

For us, sustainable development means the combination of long-term goals with environmental protection according to ISO 14001:2004 and social responsibility. It helps us to identify risks at an early stage and develop new areas of our business.

There are some critical challenges, how we cope:

1. The implementation of new technology and products with the minimum adverse affects on the environment.
2. Investment in our employees intellectual capital.
3. Constant dialog with the local community.

We are fully aware of the critical importance of the sustainable development and environmental aspects. In view of the above we continually develop our environmental policy through:

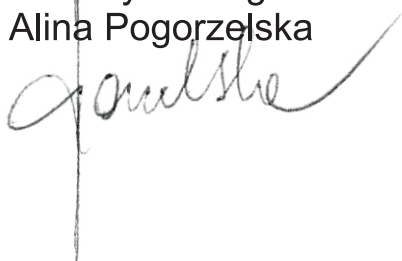

1. Fulfillment of legal regulations;
2. Reduction of waste materials;
3. Reduction of soil contamination and air emissions;
4. Continued increase in the use of recycled materials.

Our environmental policy is available on our website.

We inform our customers, suppliers, local society and the local government about all environmental aspects.
